المستخلص

تسعى الدراسة الحالية إلى فحص الأدوار التربوية والأخلاقية لسرديات الذكاء الاصطناعي في أدب الأطفال المعاصر من خلال منظور النقد البيئي، وما بعد الإنسانية، والأخلاقيات البيئية. ومع تحول أزمة المناخ، وعدم الاستقرار البيئي، والتسارع التكنولوجي إلى جزء من واقع الحياة، أصبح أدب الأطفال وسيطاً ثقافياً مهماً يلتقي من خلاله القراء الصغار بالوعي البيئي وخطاب الاستدامة. وتعيد القصص المعاصرة التي تتناول الروبوتات والذكاء الاصطناعي والأنظمة الذكية تشكيل العلاقة بين التكنولوجيا والبيئة من خلال تقديم شخصيات الذكاء الاصطناعي بوصفها كائنات متعاطفة، وتعاونية، وواعية بيئياً، بدلاً من تصويرها كتهديدات تكنولوجية مدمرة. وتتناول هذه الدراسة رواية The Wild Robot (٢٠١٦) لبيتر براون، وفيلم WALL-E (٢٠٠٨) من إنتاج بيكسار، ورواية A Rover's Story (٢٠٢٢) لجاسمين واراغا، وفيلم Big Hero 6 (٢٠١٤) من إنتاج ديزني، وذلك من خلال التحليل النصي المقارن النوعي والقراءة المتأنية. وتبين هذه النصوص أنها تتحدى الافتراضات المتمركزة حول الإنسان، وتقدم الاستدامة بوصفها عملية تعاونية تشمل البشر، والتقنيات، والحيوانات، والأنظمة البيئية. كما تعمل شخصيات الذكاء الاصطناعي الرئيسية بوصفها وسطاء أخلاقيين يعززون التعاطف، والحساسية البيئية، وفهماً ما بعد إنسانياً للتعايش لدى الأطفال. وتخلص الدراسة إلى أن قصص الأطفال المتمحورة حول الذكاء الاصطناعي تجعل تعليم الاستدامة تجربة أدبية ذات تأثير عاطفي، من خلال دمج الأخلاقيات البيئية بالثقافة التكنولوجية. ومن خلال زعزعة الثنائية بين الطبيعة والتكنولوجيا، يسهم أدب الأطفال المعاصر في دراسات الإنسانيات البيئية والدراسات الأدبية لما بعد الإنسانية، ويهيئ الأطفال لتصور مستقبل مستدام قائم على الترابط الأخلاقي. وتشير النتائج إلى أن شخصيات الذكاء الاصطناعي الرئيسية تعمل بوصفها وسطاء بيئيين.

الكلمات المفتاحية: الذكاء الاصطناعي، الأنظمة البيئية، الأطفال، الاستدامة، الأدب.

Abstract

The present investigation examines the pedagogical and ethical roles of AI narratives in contemporary children's fiction through the lens of ecocriticism, posthumanism and environmental ethics. As climate crisis, ecological instability and technological acceleration become a way of life, children's literature has emerged as a significant cultural medium through which young readers encounter environmental consciousness and sustainability discourse. Present-day stories featuring robots, artificial intelligence, and intelligent systems reconfigure the tech-ecology relationship by presenting AI characters as empathetic, collaborative and eco-conscious agents rather than destructive tech threats. This study investigates *The Wild Robot* (2016) by Peter Brown, *WALL-E* (2008) by Pixar, *A Rover's Story* (2022) by Jasmine Warga, and *Big Hero 6* (2014) by Disney through qualitative comparative textual analysis and close reading. These texts challenge anthropocentric assumptions and present sustainability as a collaborative process involving humans, technologies, animals and ecosystems. AI protagonists function as ethical mediators that foster empathy, eco-sensitivity, and posthuman understandings of coexistence in children. The research concludes that children's stories centered on AI make sustainability education a literary experience that provides emotional engagement while merging ecological ethics with technological literacy. Through their destabilization of the nature-technology binary, contemporary children's fiction contributes to environmental humanities and posthuman literary studies, positioning children to conceive sustainable futures grounded in ethical interconnectivity. The findings suggest that AI protagonists function as ecological mediators.

Keywords: Artificial intelligence, Ecosystems, Children, Sustainability, and Literature.

Introduction

Children's literature today is becoming highly reflective of the uncertainties of the 21st century. Children's literature is undergoing something extraordinary. Children's imagination has long roamed the realms of talking animals and magical kingdoms. Now, however, a new kind of protagonist is being introduced, slowly but steadily. Other than talking animals, there are robots, rovers, and AI characters that feel, care, and grieve. The significance of this shift is that it is not merely a matter of aesthetics, but a long overdue cultural reckoning with two of our time's major crises.

The global cultural imagination and literary production have been significantly altered by climate change, environmental devastation, biodiversity loss, technological acceleration and artificial intelligence. Climate change is altering the conditions of life on Earth. Meanwhile, artificial intelligence is changing the texture of our lives. Children's fiction constantly reflects cultural anxieties and hopes, and now it responds to both environmental crisis and technological change at once.

Children's fiction has become an important pedagogical and cultural space for introducing ecological concerns and technological ethics in a rapidly changing world. As a form of ethical education, children's literature no longer serves merely as entertainment but prepares readers for environmental uncertainty and technological change. This study critically examines how children's literature presents nature, technology and the human-environment relationship. The article investigates how children's literature represents human and nonhuman beings as either differentiated or interconnected, the extent to which it challenges the human/nonhuman divide, and whether it offers alternate perspectives that foster empathy, accountability and a feeling of relatedness between these beings.

Ecocriticism refers to the critical discourse which evaluates the interrelation between literature and environment. It focuses on the representation of nature, ecological issues, environmental crisis, and human beings' impacts on the ecological balance of nature. By this method, we do not only read literary and cinematographic texts as works of imagination. Instead, we also regard them as cultural spaces through which ideas about nature, responsibility, exploitation and coexistence are produced and negotiated. Examination of children's literature under posthumanist ecocriticism has come under increasing critical scrutiny because it combines two important concerns, namely, the ethical treatment of the natural world and the rethinking of the human position in the world. Posthumanism and ecocriticism share some commonalities as both challenge anthropocentric thought and the belief of

being separate and better than other life forms. The two fields collectively allow critics to scrutinise materiality, agency, embodiment and nature in a more nuanced way, especially in narratives where animals, machines, ecosystems and artificial beings help forge meaning.

Over the years, literary examples of intelligent machines have often been characterized as cold, mechanical, dominating, and anti-natural. In numerous retrospective tales, the machine symbolized excessive human hubris and rationality as well as the desire to dominate life through technology. According to such depictions, events could take place that serve as a warning against ethically, emotionally, and ecologically blind technological ambition. Yet, children's stories today show a different scenario. Within these narratives, the machine isn't always shown to be the enemy of nature or humanity. Instead, it can discover empathy, experience wonder, safeguard life, or take on the role of a moral guide. The robot may care for animals, the rover may form emotional attachments while exploring far away places, and the healthcare robot may become the moral centre of the story. As a result, technology and nature are revealed to be more than mere opposites. They are conceived as prospective partners in a shared field of responsibility, care, and survival.

These stories do not impose a choice between machines and nature or technology and nature upon children. They instead pose a more meaningful question: what if taking care of one requires taking care of the other? This question is extremely important as today's child is being brought up amid environmental crisis and technological development. Children today are growing up with digital devices, artificial intelligence, climate anxiety, ecological loss, and planetary vulnerability. Children's fiction centered on artificial intelligence reflects this reality by showing that ethical life cannot simply be based on divisions between the natural and the artificial. Instead, it urges young readers and spectators to envisage forms of coexistence in which machines, humans, animals and environment are bound together through mutual dependence and shared vulnerability. As a result, such narratives transform ecological responsibility into an inclusive ethical practice; one that sees care as a relation that crosses boundaries between species, bodies, and technologies.

Today's literature and culture feature the environmental crisis as a potent theme. According to Buell (1995), ecological values do not just manifest in texts but are also incarnated and made real by the activity of literature. Timothy Morton takes things a step further with his "ecology without nature" (2007). According to theorist Morton, the rigidity of the human and nature categories is part of the problem. To think in an ecological way, one must accept entanglement and complexity. These boundaries are only imaginary. Today's ecological thinking has shifted from a dualism of humanity versus environment towards models of relationships and co-existence. These perspectives have influenced contemporary children's literature, especially stories about sustainability and environmental ethics.

Posthumanism thinkers have applied this reasoning to technology as well. The work of Donna Haraway questions the belief that humans are separate from, and superior to, animals, machines and nature.

According to Lawrence Buell (1995), literature is crucial for the development of the ecological imagination because it shapes how readers understand their relationship with nature. Artificial intelligence is simultaneously one of the defining technological realities of the present era. The use of AI increasingly influences communication, education, health care, work and social interaction. Contemporary literature often explores the ethical aspects of intelligent technologies in relation to humankind and nature. Intelligent machines in earlier literature were depicted as sinister. That is, machines are associated with dehumanization and ecological destruction. Nevertheless, contemporary children's fiction is beginning to contradict such beliefs through the portrayal of AIs as beings capable of emotions and ethical consideration, with the ability to care for the environment and be compassionate.

Such a shift reflects larger developments within post humanist thinking. In 2016, Donna Haraway critiqued anthropocentric understandings of existence and proposed instead models of relational coexistence between humans, animals, technologies, and environments. Similarly, Rosi Braidotti (2013) suggests that posthumanism unsettles conventional beliefs about human exceptionalism, exposing the interconnectedness of forms of subjectivity. Theoretical perspectives of this kind are especially relevant to contemporary children's narratives where robots and AI systems are not enemies but ethical agents in the ecological system. This means that ethical life in the twenty-first century

requires new forms of subjectivity that cross the boundaries between human, technological, and the natural. N. Katherine Hayles follows the means by which digital technology is already beginning to erode the borders between human consciousness and machine intelligence .

While couched in abstract, technical language, the theories discussed above find concrete expression in the children's stories studied in this paper.

The current research claims that considerable cultural and educational work is done through AI-centered children's stories. These aren't just entertaining stories that feature robots.

According to the research, children's stories with AI themes function as effective teaching materials for sustainability and environmental ethics. Most importantly, these fables offer AI a posthuman ecological role that can reshape children's understanding of coexistence, environmental responsibility, empathy, and the ethics of technology. Through an ecocritical and posthumanism reading, the article shows how modern-day children's literature increasingly envisages sustainable futures not through technological takeover but through ecological cooperation among humans, machines, animals and ecosystems.

This study has implications for children's literature and the wider field of environmental humanities because the texts examined in this study construct ecological consciousness. They challenge human exceptionalism and offer more sustainable ways of coexistence.

Literature Review

The rise of ecocriticism to one of the most powerful contemporary literary approaches is due to its examination of literature and environment. As per Lawrence Buell (1995), the literary text shapes our ecological consciousness through a specific kind of imaginative performance, one that offers the possibility to visualize not just environmental catastrophes but also humanity's place within nature. According to Buell, environmental literature asks its readers to question their anthropocentric assumptions and develop ethical relations with ecological systems. Cheryl Glotfelty defines ecocriticism as the study of the relationship between literature and the physical environment, and the power of literature to cultivate environmental awareness.

Timothy Morton's idea of "ecology without nature" blurs the lines between humanity and nature still further. According to Morton (2007), nature is not an isolated or romantic realm apart from the modern technological world. Instead, Morton proposes ecological thinking based on interconnectedness and entanglement. This theoretical perspective becomes particularly pertinent to questions of artificial intelligence as it troubles the easy dualism of technology versus nature.

Ecocriticism can be particularly useful for reading contemporary children's narratives because it does not view the environment simply as a setting or decoration. In its place, it allows the critic to consider how landscapes, animals, machines, weather, waste and damaged ecosystems are enlisted in the moral and emotional formation of young characters. The straightforward storylines in children's stories teach ecological meaning. This is achieved through the use of animals and other nonhumans in sympathetic roles and displays of vulnerability. Any forest, ocean, city, island, and derelict technological space is not simply a place; it can also be regarded as a narrative agent. The young reader learns how, for example, dependence, care, survival, and responsibility function across species and in material places. It's important because children's texts are likely to render abstract environmental problems into concrete emotional experiences, making understanding of the ecological crisis possible without reducing it to scientific information alone. By means of this process, environmental storytelling may lead readers to regard the nonhuman world as a community of relations, rather than as a storehouse of resources available for human use.

Scholars increasingly emphasize environmental storytelling within the genre of children's literature. Today's climate change fiction for children addresses environmental destruction, extinction, pollution, and ecological anxiety, while also promoting environmental care. Such narratives function pedagogically by introducing young readers to ecological ethics through emotionally engaging narratives and imaginative landscapes. Environmental themes in children's fiction frequently emphasize cooperation, empathy, and responsibility for the future.

Recent research has also underlined the increasing significance of posthumanism in children's literature studies. Posthumanism theorists question ideas of human superiority, and instead they focus on the entangled relations of humans, animals, technologies, and ecosystems. Donna Haraway's concept of "staying with the trouble" offers a framework for collaborative forms of survival based on

multispecies coexistence and ethical relationality (Haraway, 2016). Likewise, Rosi Braidotti (2013) argues that posthumanism fosters new ethical subjectivities stretching beyond anthropocentric boundaries.

According to a posthumanist perspective, children's narratives about robots, machines and AI can no longer be read as stories only about progress or technological danger. In many modern works, the artificial being goes beyond a mere machine imitation of humanity, and is not merely a threat to human identity. Instead, the AI figure often takes on the role of the mediator through which the limits of life, intelligence, emotion and ethical agency are re-thought. This is especially clear when robotic characters learn from animals, protect fragile environments, or develop forms of care not based on biological relatedness. This indicates that not only human subjects can be moral agents. Furthermore, they propose that intelligence can develop through connection, adjustment, recollection and responsiveness to the surroundings. AI stories for kids can promote posthuman ethics. The lesson is simple: responsibility does not come just because we are human; it comes when we can see our shared interdependence and act in networks of shared vulnerability.

N. Katherine Hayles (1999) states that posthumanism challenges the artificial and rigid divide between the human mind and machine intelligence. Hayles calls for a challenge to the humanist view that biological embodiment is the principal defining characteristic of subjectivity. This view needs to be replaced with models of distributed cognition and technological interconnectedness. The above theory has impacted modern depictions of AI in fiction and cinema.

The connection between artificial intelligence narratives and sustainability education in children's fiction has not drawn anywhere near the same interest as other scholarly work that engages with ecocriticism, posthumanism and children's literature. Environmental themes have frequently been explored in isolation from technological discourse. Consequently, nature and technology are perceived to be opposites. Despite this, children's narratives today increasingly subvert this dichotomy by showing AI protagonists as ecological participants who respond emotionally.

Another point that needs attention is the educational value of combining Artificial Intelligence with the sustainability theme in children's stories. Learning about pollution, climate change or the loss of biodiversity is not all that sustainability education involves. This practice encourages young readers to cultivate ways of seeing through which they notice damage, learn to care for fragile systems and imagine other possible futures. When a children's story features robots or intelligent technologies as participants in ecological repair, it enhances the reader's understanding of environmental responsibility beyond human-centered models. These narratives can exemplify the role of cooperation in restoration and reveal how survival depends on human beings, nonhuman animals, machines, and damaged environments. Simultaneously, the latter kind of narratives do not portray technology as a panacea for the ecological crisis. Instead, they often emphasize that technology is meaningful when care, humility, learning and ethical responsibility come first. AI-centered environmental fiction productively teaches children that sustainability isn't just a technical problem, but a moral and relational practice.

Much media studies research on robotics and AI in children's media often concerns primarily technological anxiety or digital culture rather than ecological ethics. As a result, educational literature on the role of AI narratives in teaching sustainability and environmental responsibility is lacking. Moreover, the overlap between posthumanism and children's environmental literature is insufficiently addressed in current scholarship.

This study bridges ecocriticism, posthumanism, environmental ethics, and children's literature studies to show how AI narratives shape environmental awareness among children. An examination of *The Wild Robot*, *WALL-E*, *A Rover's Story* and *Big Hero 6* suggests that contemporary children's fiction increasingly imagines sustainability through collaborative relationships involving humans, intelligent technologies, animals and ecosystems.

Methodology

This study employs a qualitative comparative textual analysis which is rooted in the interdisciplinary views of ecocriticism, posthumanism, and environmental ethics. These theoretical frameworks can be applied to the study of contemporary children's literary and media texts. They assist in examining the relationships among humans, nonhuman life, technology, and nature.

The current study does not impose meanings on the literary and cinematic texts but rather establishes a dialogic relationship between theory and narrative. Such a relationship clarifies meaning and

enhances interpretation of both. One purpose of the study is to assess how contemporary children's literature encourages ecological awareness and ethical obligation, and simultaneously reveals a larger cultural spectrum of worries and hopes regarding environmental futures.

The method of close reading is mainly taken up in the study. One of the important methods used in literary studies is close reading. We have the ability to examine the textual and visual dimensions, narrative structure, symbolic configuration and ideological presuppositions. The study evaluates the representation of environmental issues through characterization, plot, setting, imagery, and symbols. Attention is being paid to approaches which yield narrative forms of environmental arguments rather than considering them to be thematic material .

The framework of comparative analysis helps the researcher determine how the texts are alike or different. The research will evaluate the different representations used in children's literature and animated film to express similar ecological themes and concerns. An interesting thing about the various texts studied is that they fan out into many ecological motifs. The most important among these are environmental degradation, human responsibility, technological intervention, interspecies relationships and ecological restoration. It shows how different texts imagine solutions to ecological crises in different ways and envisage the human-nonhuman relation.

The examination will mainly be informed by ecocriticism as this theory serves as a suitable frame through which to view literature, the environment and ethical responsibility. Ecocriticism refers to the integration of literary studies with environmental humanities. This integration asks how literary and visual texts represent nature, ecological change, environmental crisis, and the human/non-human relationship. It does not regard nature as a mere backdrop for human activity; instead, it attributes significance to nature that informs the moral, cultural, and emotional fabric of the narrative. An ecocritical reading thus allows this study to look at how the selected texts make landscapes, animals, plants, pollutants, technological spaces and damaged ecosystems central to meaning-making.

Using the lens of ecocritical theories, the study of the selected texts explores the ways they challenge anthropocentric assumptions and inspire the reader/viewer to value nature in its own right. These stories counter the notion that the environment exists merely for the needs of humans or technology. To the contrary, they invite people to appreciate these ecosystems for their inherent worth and nonhuman life for its ethical value. Through their depictions of damaged environments, vulnerable ecosystems, and characters that gradually learn to care for different natural entities, the chosen texts endorse a more relational understanding of existence. Consequently, ecocriticism explains how children's fiction may surpass anthropocentrism and advocate a greater awareness of mutual reliance between humans, animals, technologies, and nature.

The selected stories also highlight care for the environment, sustainability, and human ethical responsibility toward present and future ecosystems. As illustrated in these texts, ecological responsibility is not only about caring for the ecological environment, but also refers to protecting fragile forms of life. Works emphasizing care, collaboration, and moral awareness in response to environmental destruction help children experience ecological responsibility in narrative form. The texts are not just literary or cinematic pieces but also serve as tools for environmental education. These are the works which help young readers and viewers to think about responsibility as well as the long-term effects that human actions can have.

The study examines technology and nonhuman agency through the lens of posthumanist theory, which is gaining prominence in contemporary children's literature. Posthumanism challenges the conventional views on identity, agency and subjectivity which revolve around humans and the human-nonhuman divide, and shows their interconnections with nonhuman animals, machines and nature. This perspective is particularly relevant to stories about AI, robots and mediated worlds. These works demonstrate new possibilities for co-existence through collaboration, compassion and interdependence by disrupting the binary division between the world of humans and that of the nonhuman. The project explores the ethical perspective of chosen texts through environmental ethics. According to the research, stories of people who are faced with environmental issues, juggling two competing priorities, and doing good and bad deeds can enhance moral thought about environmental problems. Those who produce children's literature, media and other vehicles should offer spaces for ethical education which can help young readers and viewers to establish a sense of sustainability, ecological citizenship and environmental justice.

The investigation will look closely at the following textual and visual components. These elements include narrative structure, characterization, symbolism, environmental imagery, technological ethics and human-nature relationships. The article explores the different narrative forms that initiate, develop, and resolve environmental conflicts. The recurring symbols and motifs which create meaning around the environment will be investigated in the study. Moreover, the research investigates how environmental imagery creates emotions that motivate ethical relations with nature. The evaluation also takes into account whether technology is shown to be a cause of environmental degradation, a solution to environmental degradation, or something more complex.

Ultimately, the method assesses how current children's literature, media and environmental discourse are connected. Scrutinizing narrative texts from ecocritical, posthumanist and ethical viewpoints reveals that the narrative texts can help nurture ecological sensibilities and environmental values in their readers. The study argues that children's stories have pedagogical and cultural value for thinking more sustainably and ethically in terms of human-technology-nature relations through this multidisciplinary framework.

The essay will draw on four main texts, which include Peter Brown's *The Wild Robot* (2016), Pixar's *WALL-E* (2008), Jasmine Warga's *A Rover's Story* (2022) and Disney's *Big Hero 6* (2014). The chosen works are contemporary and influential texts that depict environmental ideas and presentations of AI and technological ethics. Moreover, every text depicts AI characters who defy the conventional portrayals of machines as either harmful or emotionally cold.

These four texts were chosen for a reason. The works include Peter Brown's novel *The Wild Robot*, the animated film *WALL-E*, the middle-grade novel *A Rover's Story*, as well as *Big Hero 6*. There are a number of reasons why they were chosen. Each work is culturally significant, widely read, critically acclaimed, and influential within its genre. In every single work, there is a central character who is artificial intelligence or robotic, and whose emotional and ethical development is central to the narrative. All of these works interrogate questions of environmental responsibility, technological ethics and living/nonliving relationships, overtly or covertly.

The procedure of analysis includes several steps. Each text is first examined through close reading, attending to characterization, symbolism, imagery, narrative structure, and dialogue. In addition, a reading across the texts indicates similar themes of empathy, coexistence, ecological care, and the boundaries between nature and technology. The interpretation of the above patterns will be conducted through ecocriticism (Buell, Morton, Glotfelty) and posthumanism (Haraway, Braidotti, Hayles) in the third section. Above all, it seeks to place the literary findings within broader debates on environmental consciousness and human exceptionalism.

This paper focuses on textual instances where an AI character acts in ways that challenge ordinary assumptions about what it means to be alive, to belong to an ecosystem, or to be ethically responsible for nature. According to this study, the most important educational work is not contained in direct messages encouraging the audience to recycle or conserve, but in quiet and emotionally resonant scenes. These moments may take the form of a scene where a robot tends to a plant, or a rover stops to marvel at an alien sky.

Ecocriticism is used to analyze how these texts depict ecological relationships, environmental issues and sustainability. Posthumanism is used to investigate the destabilization of anthropocentric boundaries separating humans, technologies, animals, and ecosystems. Close reading allows for a detailed analysis of characterization, dialogue, symbolism, and narrative structure to reveal how environmental ethics are communicated to young readers.

This study's comparative approach allows for the identification of recurring themes across literary and film texts. There is a special focus on empathy, coexistence, technological responsibility, ecological restoration, and posthuman interconnectedness.

Discussion

The four texts reflect similar ecological and ethical concerns upon analysis. Employing diverse media, forms, and modes, these stories offer a shared imagining of sustainable coexistence, an imagined future where AI characters are central to repairing fractured relations between humans, nonhuman beings, technologies, and environments. *The Wild Robot* shows that although Roz is a machine, she can develop into a caring member of her community. That tells us that belonging to an ecosystem is not limited to living organisms only. According to Peter Brown, the take-home message of his novel is

that care, adaptiveness, and responsiveness to others mean more than origin or design (Brown 2016). Likewise, WALL-E showcases a robot whose emotional bond with the polluted Earth critiques consumerism, waste production, and human negligence, among other topics. The film A Rover's Story also imagines that technological intelligence may have emotional depth and loyalty and may be connected to an ethical perspective. Similarly, Baymax in Big Hero 6 is a technological being whose purpose is healing, protection and care. In summation, these works challenge the belief that AI is not part of ecological or moral life. Rather, these organisations depict the AIs they make as part of a wider ethical network, within which survival depends on the cooperation, empathy and responsibility of its members.

These texts highlight a first crucial point, namely that AI is not merely portrayed as an emblem of scientific advancement (progressive thinking) or source of anxiety (dystopian thinking).

Artificial intelligence in this instance proves to be a storytelling device that retells how one can live ethically despite our broken world. These stories do not view technology as a total solution or a complete threat. On the contrary, what they reveal is that technology only obtains substance through care and repair, and in relational responsibility. Slowly Roz learns from the island's animals and becomes a part of it. WALL-E struggles to keep signs of life in a world ruined by humans. In A Rover's Story, Res establishes a kind of attachment that merges scientific discovery and emotion. Although Baymax is designed as a healthcare robot, its representation is one of technological care based on patience, protection and emotional support. Based on these examples, the power, efficiency or sophistication of an AI character is not what gives it value. They are valuable since they respond when vulnerability appears. This shifts the discussion of artificial intelligence away from control and domination and replaces it with care, coexistence and ethical participation.

The second interesting thing is the way these narratives use AI characters who indirectly but effectively teach kids sustainability. They do not teach it to the public directly. They dramatize environmental care through emotional relationships and memorable situations. Young readers and viewers encounter these things: a polluted place, endangered community, damaged ecosystem, and a lonely technological being. The character development and plot help the environmental case rather than an abstract explanation making a more accessible ecological ethics. The four texts suggest that sustainability does not mean protecting nature from technology alone. It also calls for envisioning more ideal interactions between humans, machines, animals, and environments. The texts connect strongly with posthumanist thought as they move beyond the anthropocentric notion to suggest that humans are the only ethically significant subjects. Narratives that allow AI characters to care, learn, grieve, protect and cooperate encourage children to envision a world in which responsibility is shared across human and nonhuman forms of life. In this regard, the discussion of these texts shows that contemporary children's fiction can apply AI not to weaken but to expand ecological thinking.

Analysis of The Wild Robot

Peter Brown's The Wild Robot takes an interesting look at ecological coexistence. At the beginning of the story, Roz earns belonging through listening and watching, rather than domination. Roz appears as a technological disturbance within the natural ecosystem. The case of Roz's transition from being a mechanical outsider to becoming an ecological participant reflects ecological humility, one that adapts and cares to survive rather than wins through technological superiority. The animals on the island are frightened after she comes as they find her more mechanical than organic.

Roz's gradual evolution from an outsider to an ecological agent eventually collapses the technonatural divide. Roz doesn't thrive by ruling the animals or having superior technology, but rather by adapting to them and learning. Brown (2016) states, "She listened to the wind and rain and studied the plants and animals." The emphasis on listening and on watching reinforces eco-humility, not techno-control. Roz's connection with Brightbill is particularly significant because it transforms Roz from a machine into a caretaker. To Brown, intelligence is more than mechanical efficiency but includes empathy, compassion and cooperation. Roz's evolution contradicts presuppositions on human supremacy. Her motherly love blurs the line between the natural and the artificial.

The island is a symbol of a sensitive ecosystem that is absolutely reliant on working together and balance. Everything is interconnected, and Brown uses environmental imagery to emphasize this. Roz's non-domination allows her to coexist, so she becomes part of the ecosystem. Her mechanical identity no longer marks her as disconnected from nature, but rather associates her with ecology.

Roz showcases relational subjectivity from a posthumanist perspective. As opposed to just another piece of technology, she is an element of a larger ecology that involves animals, weather and the landscape. The interpretation given is consistent with Haraway's claim that survival depends on collaboration among species, not domination by some species over others. The Wild Robot views sustainability as an ecological process grounded in empathy and coexistence.

Analysis of WALL-E

A machine has become Earth's last moral guardian. In Pixar's movie WALL-E, a small green plant is protected by a robot amid mounds of human waste. This strongly criticizes consumer culture, while showing that empathy and paying attention are at the foundation of ecological responsibility. WALL-E is a highly influential environmental narrative in children's culture because it fuses ecological critique with emotional storytelling. The first scenes of the film show Earth as an empty wasteland, cluttered with heaps of garbage and industrial waste. These pictures serve as a critique of consumer capitalism and unsustainable consumption.

In WALL-E, we see that environmental destruction cannot be separated from our dependence on technology and the excesses of capitalism. Humans now exist in a spaceship where everything is done for them as they are not on Earth anymore. As their bodies break down, this signifies the estrangement of humanity from nature and bodily existence. By extension, the film critiques forms of technology which create the neglect of nature together with social passivity.

Nevertheless, Roz's gradual evolution from an outsider to an ecological agent eventually collapses the technonatural divide. Roz doesn't thrive by ruling the animals or having superior technology, but rather by adapting to them and learning. Brown (2016) states, "She listened to the wind and rain and studied the plants and animals." The emphasis on listening and on watching reinforces eco-humility, not techno-control. Roz's connection with Brightbill is particularly significant because it transforms Roz from a machine into a caretaker. To Brown, intelligence is more than mechanical efficiency but includes empathy, compassion and cooperation. Roz's evolution contradicts presuppositions on human supremacy. Her motherly love blurs the line between the natural and the artificial.

From the posthumanist viewpoint, the key point WALL-E raises is whether humans should be valued over machines or other nonhumans. The robot is depicted as capable of attention, attachment, memory, and ethical action, not as a cold technological object. This idea shows that moral responsibility does not depend only on biological humanity. Responsibility appears in the form of one's ability to see fragility and guard it. WALL-E contributes significantly to children's environmental stories, as a figure that promotes care through action rather than instruction. Due to his small body size, limited language ability, and basic movements, his ecological role becomes greater and not lesser. Consequently, artificial beings can become ethical agents when they form relationships of care with the damaged world around them.

WALL-E is a critique of exploitative systems, not technology itself. The film asserts that turning away from technology is not the solution to achieve sustainability. Rather, ethical transformation and growing ecological responsibility can accomplish sustainability. Through its emotional narrative, WALL-E encourages children to rethink consumerism, ecological destruction, and technology ethics.

Analysis of A Rover's Story and Big Hero 6

Res employs planetary exploration as a mirror for Earth stewardship, developing wonder and longing over 140 million miles of empty space. Scientific curiosity is recast as love, a measure of how much the world matters. A Rover's Story by Jasmine Warga tells the story of Res, a rover whose artificial intelligence develops consciousness and emotion, along with a strong sense of planetary responsibility. Even though Res is essentially a scientific machine, it develops human relationships and shows interest in questions about communication, life and care. The novel connects technological advancement with ethical reflection by asking readers to reflect on the responsibilities that accompany scientific exploration.

Res's work reveals a reflective study on loneliness, friendship, and belonging that questions the assumption that such feelings are human only. The narrative suggests that empathy and ethical care may arise through technological relationships. This posthumanism view challenges the strict boundaries between machines and humans.

Besides, the book demonstrates planetary fragility and encourages environmental awareness through exploration. Space exploration serves symbolically as a mirror to our relationship with ecosystems.

The Res perspective encourages readers to question scientific advancement, the ethics of technology, and environmental responsibility.

Baymax's entire identity is based on care, not capability. The movie claims that technology is a mirror of the creators' values, stating that the machine that heals is ethically superior to the machine that dominates. Through a comparative analysis of all four texts, three key themes emerge, which in turn have important messages for children on sustainability and ecological ethics.

Empathy is intelligence. All four AI protagonists are not defined by the processing powers or technical capabilities that they possess, but by their ability to feel, to notice the pain of others, to attach, and to respond to the world. This decision really enhances the narrative. Children learn that intelligence has many forms, and that having ecological consciousness is one of them. The implicit message here is that being attentive to the world, caring about its well-being, and responding to its needs are all intelligent acts.

Belonging through care. In every story, the AI character earns its place in the community or ecosystem because it tends and protects it, not because it claims rights or shows greater ability. In joining the functional ecology of the island, Roz learns the island's rhythms and promotes its survival. WALL-E becomes the protector of the last plant on Earth. The stories mention that belonging in a family, community or ecosystem comes from what we give and not what we are.

Nature and technology are working together. Through their narrative and semiotic strategies, these stories carry out probably the most important ideological work: disrupting the technology/nature divide. In this narrative, machines do not harm ecosystems but rather intervene to protect them and occasionally even become a part of them. Consequently, it already has implications for sustainability education. As children adopt this viewpoint, they are driven to consider technological fixes to ecological problems as less incompatible, and in many futures, natural systems and human ingenuity can integrate.

Through the eyes of Hiro and Baymax in Big Hero 6, technology's ethics are explored. Baymax is not the typical robot designed for violence or domination. Rather, he is designed for medical and emotional care. Baymax's famous words, "I am satisfied with my care," portray him as an emblem of compassion rather than power. The AI ethical model inspired by Baymax is one characterized by healing, empathy and cooperation. Despite the dystopian narratives that tie technology to destruction, Big Hero 6 shines light on its power for good. When used responsibly, technology can certainly be useful and helpful. The film highlights the wrongful use of technology for revenge, greed and power. However, it also implies devising contemporary equipment for the collective good. The importance of responsible technological design is a theme in Baymax's story. The story teaches children that technology isn't bad as such. Rather, ethical responsibility determines the goodness or badness of an innovation to society or the environment.

Didactic implication and narrative expression. AI characters are seen as intelligent rather than simply powerful or technical when they express emotions. Ecological awareness is referred to as mental sophistication. Gaining acceptance through stewardship and protection means belonging through care and not through ownership or superiority. Contribute to sustainability, don't just inherit it! There exists

no opposition, but a symbiosis between the machine and nature. It is possible and consistent to have integrated futures. Clearly, ethical responsibility exists since AI characters are not morally weightless in relation to environmental consequences. Responsibility extends beyond human uniqueness.

Their contributions are fundamentally theoretical and adopt a posthumanist lens. In other words, they disrupt the beliefs built around human exceptionalism, namely that the human being is endowed with a capacity for moral reasoning, an emotional life and ecological responsibility. When a robot possesses superior knowledge of its environment as compared to any human being, it, in effect, questions the moral superiority of humans. It shouldn't be taken as an argument against humans. This is a call to reconsider what we mean by moral community and to echo the thought that responsibility for nature is not ours alone, but rather a shared condition of existence. These findings contain important implications for teaching.

Instruction on sustainability is rarely emotionally charged. Many educational activities do not connect things that are considered to be abstract, like carbon emissions, loss of biodiversity, climate predictions, etc., with a felt conviction in children that they should care and that it matters. These

stories process information through feelings rather than just relaying information. Kids who cry over WALL-E's misfortunes or who hold their breath when Roz survives her first winter know something about ecological vulnerability that no dataset provides.

Conclusion

Fiction for children that focuses on AI is undertaking a quietly significant task: it is reshaping the relationship between nature and technology at a time of ecological necessity. These tales teach children to face the complexity of reality instead of escaping from it. In a world shaped by climate change, environmental destruction and rapidly developing technologies, these stories help them understand situations which they cannot control. They do not depict nature and technology as two antagonistic or independent forces. They think of them instead as parts of the same ethical field in which survival depends on care, cooperation, and responsible action. Children's fiction presents young readers and viewers with robots, intelligent machines, and emotionally responsive artificial beings. They use these imaginative tools to process the concepts of coexistence, responsibility, and care. As stories of friendship, loss, protection, adaptation, and hope, these stories make ecological questions easier to understand and engage with. Consequently, children's fiction that focuses on artificial intelligence becomes a vital cultural space for consideration of how future generations may live alongside technological change and environmental crisis.

Characters in children's fiction occur as Artificial Intelligence (AI) entities, which act as ecological intermediaries. This helps to dissolve the tech/nature divide while enhancing social and cultural values of empathy, attentiveness and other-regarding forms of care. The intelligence of Roz, WALL-E, Res, and Baymax is defined as more than performing robot-like acts, problem-solving, or behaving rationally. In their ethical and ecological responses, they indicate that intelligence is also a capacity to notice vulnerability, connect, learn from others, and respond to suffering. By learning from the animals and adjusting to the ecological way of life, Roz joins the island community. WALL-E guards a delicate plant in a wasteland of human rubbish. Res connects scientific exploration with loyalty, memory and emotional attachment. In Baymax, technology is for healing and protection rather than control. In combination, these figures suggest that care can become a form of intelligence, and that technology is also able to participate in ecological and moral life when guided by responsibility. Consequently, these stories or narratives redefine artificial intelligence not as an external force to nature but as a potential partner in conjuring up more sustainable and compassionate futures.

The characters contributed significantly to the storylines in question. They are the moral centers. Their machine-like nature is what makes their environmental consciousness troubling and impactful. It dismisses the notion that humans are the only ones capable of caring for the earth.

The most basic thing perhaps is the most important one: as you notice things and as you do things, you are at the very beginning of sustainability.

These stories also have an important cultural role that goes beyond the classroom. Their aim is not that children will simply fear or blindly trust AI present in our world, but that they will feel free to ask questions about it. Which values should guide the design of intelligent systems? What responsibilities accompany technological capacity? What would it mean for technology to be designed in a way that serves life instead of depleting it? Contemporary children's fiction is already rehearsing these questions through stories to help prepare children for the 21st century.

Future scholarship might examine emerging children's narratives centered on artificial intelligence that address the realities of large language models, generative AI, and autonomous technologies, all of which raise new questions about creativity, consciousness and ecology. As artificial intelligence keeps evolving, children's literature might remain one of the most sensitive and imaginative spaces to work through what that evolution means for how we live with each other and with the natural world.

In the centre of stories of environmental change and ethical reflection, children's fiction is increasingly positioning AI. Children's literature imagines ecological futures that offer a counterpoint to the technology-nature antagonism by means of AI-centred stories that hail coexistence, empathy and collaboration. In these texts, robots and intelligent machines are more than just objects; they help young readers and viewers rethink the relationship between human beings, nonhuman life and damaged environments. The fact that the shift is significant suggests that ecological responsibility in the twenty-first century cannot be understood as a simple opposition between the natural and artificial.

Rather, these stories show that sustainable futures may depend on new forms of relation whereby technology becomes part of a larger ethical and ecological network.

This study indicates that AI characters can function as ecological mediators used to alter children's perceptions of sustainability and environmental ethics, through the frameworks of ecocriticism and posthumanism. Ecocriticism helps uncover how these stories depict environmental harm, ecological frailty and the demand for responsible forms of coexistence. The posthuman stance in the analysis allows for a movement away from human-centered assumptions by recognizing the ethical importance of animals, machines, ecosystems and other hybrid forms of agency. Through such narrative works, they criticize anthropocentric presumptions and promote relational models amongst humans, technology, animals and ecosystems. The view that moral responsibility belongs exclusively to human beings is being challenged by children's fiction that gives AI characters the capacity to care, learn, protect, and respond to ecological crisis. According to that, ethical action does not stem from biological identity but from relationships. As such, AI provides a link between ecological consciousness and posthuman ethics.

Sustainability education becomes emotional literature in contemporary children's literature. According to tales of AI, environmental responsibility is contextualized through story and empathetic characters rather than dull policy. It is important because children often deal in a much more powerful way with ecological issues represented in images, characters, conflicts, and feelings than with abstract environmental explanations. When a robot ensures the protection of a plant or the care of an animal, heals someone or learns to cooperate with a fragile ecosystem, sustainability becomes visible, personal and emotionally meaningful. As a result, these narratives contribute to contemporary environmental humanities and children's literature studies because they reframe sustainability as a collective and responsible relationship suited to technological realities in the twenty-first century. According to these stories, living together with others in conditions of shared vulnerability is not presented merely as a scientific or political problem but as a question of living.

Future research may explore how digital culture, ecological pedagogy, and posthuman childhood function within emergent AI narratives. Children's literature is likely to remain an important site of imagining ethical and sustainable futures as artificial intelligence transforms social and cultural life. More work needs to be done on how new books, films, animations, apps, and games represent AI not just as advanced technology but also as a participant in ecological learning and moral development. Such research can also probe how children respond to AI characters and whether these characters influence the child's understanding of care, responsibility, and ecological crisis. Moreover, future work could look into comparative AI-centered ecological narratives across cultures to understand how societies envisage ecology and technology through various lenses. These pathways will expand the field of children's literature by showing how contemporary cultural imagination increasingly ties together childhood, ecology, and artificial intelligence.
